

GreenClean Pond Treatment is an alternative to copper-based algaecides that has numerous uses for aquatic applicators. GreenClean works through an oxidation mode of action, quickly killing algae on contact. A beneficial by-product of the oxidation reaction is a release of oxygen into the water column.

Ideal Aquatic Applications for GreenClean

- Water bodies where copper applications are limited or not appropriate, or where algae has become Cu resistant. GreenClean can be used in rotation with copper products as a form of resistance management.
- Irrigation ponds, lakes or canals where copper build-up or residues have or could become problematic. Golf courses, agriculture, and greenhouses and nurseries are areas where this could be an issue.
- GreenClean is excellent in conjunction with beneficial bacteria products. GreenClean will provide a quick algae knockdown allowing beneficial bacteria to work better and faster. This is an excellent program approach for algae prevention.
- For fish hatcheries and farmers, GreenClean is an extremely safe alternative for algae control and does not harm fish and aquatic life.
- GreenClean is ideal for water features and fountains as it will not discolor concrete or react with synthetic liners.

Application of GreenClean

GreenClean can be applied in a number of ways including:

- Through a mechanical spreader such as a Cyclone or Garber electric seeder
- Broadcast by scoop or shovel for shoreline areas
- Through a power blower, or
- As a flowable providing agitating tanks are used

GreenClean Pond Treatment

GreenClean is a small granular with a salt-like consistency that will sink in a water column. Since GreenClean releases oxygen, some organic matter may float to the surface of the water body shortly after application.

Application Rates

Maintenance Rates

Per acre-foot of water	3 to 17 pounds
Per million gallons of water	9 to 52 pounds

Heavy Infestations

Per acre-foot of water	30 to 150 pounds
Per million gallons of water	90 to 500 pounds
